

SANDBOX-XTRACTOR

Automated Deployment & Testing Guide

Step 1: Bring the Blueprints to Your Computer

First, we need to download the project folders so your computer knows what to build.

- Open your computer's command line (the black screen where you type commands).
- Type a `git clone` command to download the `Sandbox-Xtractor` project straight from GitHub.
- Next, open the folder you just downloaded by typing `cd Sandbox-Xtractor`.

Step 2: Give the Robots Their Secret Keys

To make the tool super smart, you have to wake up the AI robot brains! 🧠

- Look in the folder for a file named `.env.example`.
- Inside this file, there are blank spaces. You need to paste your secret passwords (called API keys) for different AI models like Google Gemini, Anthropic Claude, and OpenAI ChatGPT.

Step 3: Add the Extra Puzzle Pieces

The tool needs some extra little helper programs to work perfectly.

- Look at the `packages.txt` file. It says you need to install a special helper called `libmagic1`.
- Look at the `requirements.txt` file. This tells your computer to install Python helpers, like `pdftkit` to make reading the final reports easy, and `celery` to manage heavy lifting!

Step 4: Build the Safe Testing Rooms

Now you tell Docker to build all the special rooms for testing! 🏠

The project uses a big instruction manual called `docker-compose.yml`.

When you run it, Docker will magically create a few cool things:

- 🧑 **An Orchestrator:** The boss that tells everyone what to do.
- 📧 **Redis:** The fast messenger pigeon that carries notes.
- 🙋 **A Celery Worker:** The strong helper doing the heavy lifting and running the tests.
- 📱 **An Android Sandbox (Redroid):** A fake phone space to safely test mobile apps.

Step 5: Test a Mystery File!

Once everything is built and running smoothly, you are ready to use it! 🎉

- Submit a suspicious file into the system.
- The system traps the file in the safe box and watches everything it tries to do. 🕵️
- The smart AI robots read the notes and write a super detailed report telling you exactly how dangerous the file really was! 🛡️
