

SandBoX-XtractOr

Architectural Overview & Analytics

System Architecture

The following diagram illustrates the high-level architecture of the SandBoX-XtractOr security analysis engine. It shows the flow from user submission through the orchestration layer, into isolated sandbox environments, followed by telemetry extraction and AI-powered threat analysis.

Codebase Distribution

SandBoX-XtractOr is built using a variety of languages to ensure cross-platform compatibility and low-level system access. Python is the dominant language, facilitating the orchestration and AI integration, while Rust and C/C++ handle core performance-intensive tasks.

Language	Percentage	Primary Use Cases
Python	67.3%	Orchestration, AI Bot Integration, API endpoints
Shell	12.4%	Automation, environment setup, deployment scripts
JavaScript	9.7%	Frontend dashboards and visualizations
Rust	8.2%	High-performance low-level telemetry, safety

Language	Percentage	Primary Use Cases
Other (Ruby, Dockerfile, etc.)	2.4%	Containerization, auxiliary tools
